

ITS Test Block Covers

The ITS Test Block Covers are used to prevent dust and other objects from getting into the contacts of the Test Block modules. Each cover is made of aluminum which is cut to size to protect any number of modules. These low profile covers can be painted to match the customers panel paint specifications and can be easily removed and mounted.

Assembly Instructions

The enclosed screws and washers must be assembled as illustrated below.

FT Style Cover Compatibility

The ITS is also compatible with plastic FT style covers. One benefit to this style of cover is that the Test Plug can be inserted into the Test Block with the cover in place. By offering this compatibility the customer may re-use the covers that he already has in the substation.
