

## Interface Test System - ITS

The ITS is your interface for relay and meter testing. The system is now ready for ring connectors. Measurements match those of test switch brands – retrofit your panel with the ITS!

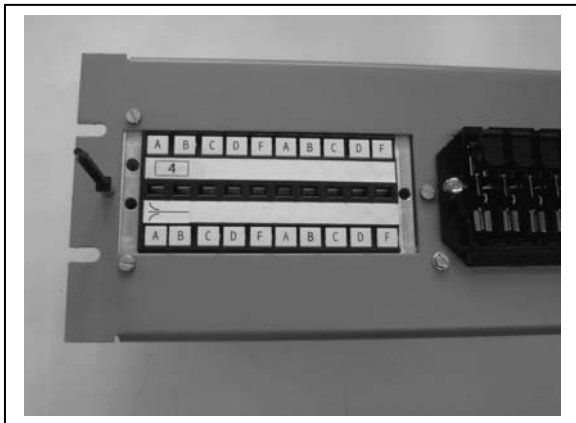

The ITS makes testing safer and more economical:

- Modularity allows for your custom made solutions
- Finger safety guaranteed in block and plug
- Elimination of accidents in opening and reclosing
- Optimal conductivity leads the way to today's relays and meters

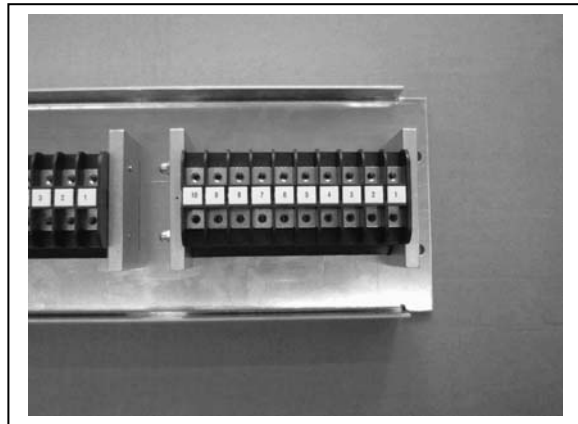

### The test block now welcomes ring lugs!

The proven working principle of the ITS has remained unchanged: Two copper springs held together by pressure springs guarantee superior conductivity during normal operation. When the test plug is inserted, circuits are automatically opened and redirected via the test plug. But now the test block is equipped for ring lugs, making the connection in the panel even safer.

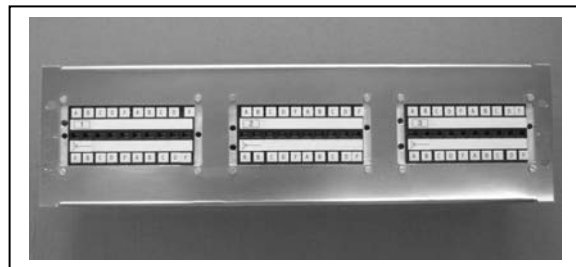

Today's relays and meters are becoming more sophisticated, calling for optimal material in auxiliary equipment. The ITS uses high quality conductive materials - **silver, copper and brass**

protect the relay or meter from fault sources that lie in its periphery and have to be avoided.

**The new modular units of the ITS are made to fit the same measurements as FT switches.** Thirty contacts can easily fit a 19 inch rack, achieving the usual setup of 10-10-10. No new cutouts in the metalwork necessary - **you can retrofit with the ITS.**

We'll be happy to offer you a custom made solution!
